

# Mobile Manipulators

Posilift supplies a range of portable manipulators. These are often needed when (i) the reach of the manipulator is not sufficient to reach all parts of the work area and (ii) it is not possible or not feasible to use overhead tracking to cover the extra distance.

â€‹

The Famatec Gingo is a manipulator specifically designed for portability. It is not limited by the availability of factory compressed air. The Famatec Gingo generates its own venturi vacuum using a battery powered air compressor mounted on the ground trolley. This allows off-site and outdoor use. It is commonly used by builders for lifting large glass panels off a truck or for lifting and positioning glass windows for fitment on a shop front or building.

â€‹

Armtec has incorporated pneumatic toolings with manual and battery powered pallet movers. They can use battery powered compressors to be completely independent and can be used inside or outside with weights up to 1000kg. Manipulators can also be attached to a moveable base plate for easy re-location using a pallet lifter, forklift, or similar.
